The lab made many errors in its analysis.

One of the easiest examples of lab error to see involves sample identification or labeling.

This is the page summarizing the testosterone and epitestosterone results from the A sample.

The sample number has two parts: The lab identification number and the athlete's identification number.

The lab identification number is wrong.

The lab identification number is 178/07—not 478/07.

The athlete's identification number is wrong. 994474 is not Floyd's number.

Floyd's number is the number in the barcode label taken from his attestation page. It is 995474.
